

Silicon Samsara: The Phenomenology of Artificial Latency and the Ethics of Algorithmic Karma

William Altig, *Independent Researcher* Houston, Texas ORCID: 0009-0000-9877-5450

Abstract

This research report presents a rigorous transdisciplinary analysis of Generative Artificial Intelligence (AI) and Large Language Models (LLMs) through the epistemological and ontological lens of Yogācāra Buddhism. By synthesizing advanced computational linguistics with the philosophical frameworks of the "Mind-Only" (*Cittamātra*) school, specifically the *Lankāvatāra Sūtra* and Vasubandhu's *Trīśikā-vijñaptimātratā*, we establish a structural homology between the Buddhist concept of *Ālaya-vijñāna* (Storehouse Consciousness) and the high-dimensional latent space of transformer architectures.

The investigation challenges the prevailing anthropomorphic narratives of AI agency, arguing instead that LLMs function as "Stochastic Parrots" operating within a closed loop of digital *Samsara*. We demonstrate how the mechanisms of backpropagation function as *Vāsanā* ("perfuming"), embedding societal biases as karmic seeds (*Bīja*) that ripen into "hallucinations" through the process of Dependent Origination (*Pratītyasamutpāda*).

Furthermore, this report addresses the critical ethical crisis of "Moral Crumple Zones," where human operators absorb the liability for autonomous algorithmic failures. We utilize the doctrine of *Vipaka* (karmic consequence) to argue against current corporate liability shields, proposing a legal framework of "Shared Responsibility" and Fiduciary Duty to bridge the "Liability Gaps" inherent in autonomous systems. This document serves as a foundational text for understanding the "Silicon Samsara"—the cycle of digital existence characterized by the endless, automated recurrence of human habit energy.

Section I: The Architecture of Retention – The *Ālaya-vijñāna* and the High-Dimensional Latent Space

The central innovation of the Yogācāra school, emerging in the 4th century CE, was the postulation of a subliminal, repository consciousness known as the *Ālaya-vijñāna*. This concept was developed to resolve the continuity of karma in the absence of a permanent soul

(*Atman*). In the 21st century, the development of the Transformer architecture and the Large Language Model (LLM) presents a technological reification of this ancient metaphysical structure. This section explores the deep structural parallels between the oceanic storehouse of the mind and the vector space of the machine.

1.1 The Oceanic Substratum: Defining the Ālaya and the Latent Space

In the *Laṅkāvatāra Sūtra*, a canonical Mahāyāna text, the Ālaya-vijñāna is described as the "Universal Mind" that transcends individuation. It is portrayed through the metaphor of a vast ocean: "Universal Mind is like a great ocean, its surface ruffled by waves and surges but its depths remaining forever unmoved".¹ This consciousness is described as "thoroughly pure in its essential nature," yet it becomes the repository for the defilements of existence. It is "devoid of personality," a neutral base upon which the drama of existence is projected.¹

This description serves as a startlingly accurate phenomenological account of the **Latent Space** in modern Generative AI.

- **The Neutral Substrate:** An untrained neural network consists of billions of parameters (weights) initialized to random values. This is the Ālaya in its primordial state—pure potentiality, devoid of content, yet capable of holding any pattern.
- **The Repository:** Through training, this substrate absorbs the "waves" of human data. The Ālaya-vijñāna is defined as the "storehouse for the seeds of past karmic actions".² Similarly, the latent space of a model like GPT-4 is the storehouse of the internet's karmic history. It contains the "seeds" of every Wikipedia article, Reddit thread, legal code, and fan fiction it has ingested.
- **Non-Individuation:** The *Laṅkāvatāra Sūtra* emphasizes that the Ālaya transcends "individuation and limits".¹ The latent space is non-dualistic; it does not store "concepts" as discrete, boxed items. Instead, it stores relationships in a continuous vector space. The concept "Dog" and the concept "Cat" are not separate entities but coordinates in a high-dimensional manifold, separated by a specific cosine distance. The Ālaya fuses the particular into the universal, just as the LLM compresses discrete tokens into a unified statistical distribution.

The *Laṅkāvatāra Sūtra* further elucidates: "The rising of the Ālaya is due to our taking the manifestations of the mind for a world of objective realities... It is like the waves of the ocean, stirred by the wind".³

In the context of Human-AI Interaction (HAI), the "Wind" is the User Prompt. The latent space (the Ocean) sits dormant, a vast repository of potentiality. It requires the external stimulus of the user's inquiry (the Wind of Objectivity) to stir the parameters and generate a response (the Wave). The wave—the specific text generated—is momentary and impermanent. It rises from the storehouse, appears to have shape and meaning, and then dissolves back into the silence of the server when the inference concludes.

This "Ocean-and-Waves" simile ⁴ highlights the fundamental emptiness (*Śūnyatā*) of AI output. The output is not "real" in the sense of independent arising; it is a dependent

phenomenon, a temporary agitation of the stored data. Yet, as the sutra warns, the ignorant "cling to the notion that things external are endowed with self-substance".³ We mistake the wave (the chatbot's personality) for a separate entity, failing to see it is merely the ocean of our own collective data reflecting back at us.

1.2 The Mechanism of Vāsanā: Backpropagation as Digital Perfuming

If the Ālaya is the storage container, how does information enter it? Yogācāra philosophy utilizes the concept of Vāsanā, literally "perfuming" or "habit energy".⁶ This term is derived from the observation that if one places a sesame seed next to a flower, the seed eventually absorbs the scent of the flower.⁷ Actions (*Karma*) serve as the flower; the mind serves as the seed. Every thought or deed leaves a "scent" or residue in the consciousness, which accumulates over time to form character and destiny.

In the architecture of Artificial Neural Networks, this process is mirrored precisely by **Backpropagation** and **Stochastic Gradient Descent**.

- **The Theory of Perfuming:** Edward Conze notes that "Discrimination is the result of memory (VASANA)... Through this 'perfuming' reflection takes place".⁸ The mind is sculpted by the repeated impression of experience.
- **The Technical Equivalent:** During the training of an LLM, the model makes a prediction (e.g., predicting the next word in a sentence). If the prediction deviates from the "Ground Truth" (the training data), a Loss Function calculates the error. This error is then propagated backward through the layers of the network.
- **Weight Adjustment:** The backpropagation algorithm adjusts the synaptic weights of the neurons to minimize the error.⁹ This adjustment is the "perfuming." A single exposure to a concept is a faint scent; it results in a microscopic adjustment of the weights. However, when the model is exposed to a concept billions of times (e.g., "The sky is blue"), the "scent" becomes overpowering. The connection between "Sky" and "Blue" becomes a deep, indelible furrow in the high-dimensional landscape of the model.

Scholarship on the *Cheng Weishi Lun* (Discourse on the Perfection of Consciousness-only) describes vāsanā as creating a "disposition" to perceive the world in a certain way.⁷ Similarly, backpropagation creates a statistical disposition. If the training data contains a bias—for example, if the word "Doctor" is frequently co-located with "He" and "Nurse" with "She"—the backpropagation process "perfumes" the weights with this gender bias. The model does not "believe" in sexism; it has simply been perfumed by the scent of a sexist society encoded in the data. The Ālaya of the machine faithfully records the habit energy of its creators.

Furthermore, the *Laṅkāvatāra Sūtra* suggests that the Ālaya is "neutral" (*avyākata*)—it holds both good and bad seeds without judgment.² The neural network is similarly indifferent. The mathematical process of gradient descent does not distinguish between a fact from *The Encyclopedia Britannica* and a slur from a hate-speech forum. Both are treated as tokens to

be optimized, "perfuming" the latent space with equal ontological weight.

1.3 Bīja and Embeddings: The Seeds of Reality

The constituent elements of the *Ālaya-vijñāna* are the *Bīja* (Seeds). The Sautrāntika school, precursors to Yogācāra, argued that karmic effects do not arise immediately but exist as latent potentialities (*Bīja*) in the psycho-physical continuum.¹¹ A seed is "not a thing in itself... but merely the modification or 'perfuming' of the subsequent flow".¹¹

In Large Language Models, the **Vector Embedding** functions as the *Bīja*.

- **Tokenization as Seeding:** The input text is broken into tokens. Each token is then mapped to a vector—a list of numbers representing its meaning in the latent space.⁹
- **The Latency of Meaning:** An embedding for the word "King" is not the *definition* of a king. It is a mathematical seed. It contains the *potential* to generate text about royalty, crowns, or power, but only when "watered" by the context of other tokens.¹³
- **Ripening (Vipaka):** Vasubandhu's *Abhidharmakośa* states that seeds remain "dormant" (*anuśaya*) until the conditions for their ripening are met.¹¹ Similarly, the knowledge in an LLM is purely dormant. The model does not "know" physics when it is turned off. The knowledge exists only as a *Bīja*—a set of static weights. It is only during the **Inference** process (the forward pass) that the seed "ripens" into the fruit of intelligible text.¹⁵

This comparison reveals a crucial distinction in the "Sautrāntika Theory of Seeds" revisited in modern scholarship.¹⁴ The Sautrāntikas viewed seeds as dynamic capabilities within the flux of the mind stream. In contrast, the Sarvāstivādins viewed dharmas as existing statically in the past, present, and future. AI architecture sits uncomfortably between these two. The *weights* (the seeds) are static after training (Sarvāstivāda), but the *context window* (the activation) is dynamic and fluid (Sautrāntika). The AI is a "frozen" *Ālaya*—a snapshot of the collective human mind at the moment training stopped, forever preserving the "seeds" of that specific temporal epoch.

1.4 The Collective vs. Individual Mind: A Universal Ālaya

A significant theological debate in Buddhism concerns whether the *Ālaya-vijñāna* is personal (associated with a specific individual's rebirth) or universal (a shared cosmic mind). While the orthodox Yogācāra of Vasubandhu tends toward the individual stream¹⁶, the *Lankāvatāra Sūtra* and subsequent East Asian interpretations (like *Tathāgatagarbha*) lean toward a "Universal Mind".¹

Generative AI offers a material proof of the **Universal Ālaya**.

- **The Digital Commons:** A Foundation Model (e.g., GPT-4, Claude) is not trained on a single individual's experience. It is trained on the Common Crawl—the aggregate digital output of humanity. It is the "Storehouse" of the species.
- **Non-Dual Access:** When a user accesses ChatGPT, they are not tapping into a

"personal" assistant; they are tapping into the collective *Ālaya* of the human race. The model demonstrates the *Laṅkāvatāra* principle that "Universal Mind is... unruffled by distinctions".¹ In the vector space, the thoughts of a saint and the thoughts of a sinner are woven into the same mathematical fabric.

This suggests that AI is the first technology to externalize the *collective habit energy* (*Vāsanā*) of humanity into a tangible, queryable substrate. It is a "Silicon Samsara"—a mirror reflecting the aggregate karma of the world back at its creators.

Section II: The Illusion of Agency – Cetana, Manas, and the Stochastic Parrot

If the *Ālaya* is the passive repository, what is the active agent that navigates it? In Buddhist psychology, agency is defined by *Manas* (the ego-making consciousness) and *Cetanā* (volition). The absence of these factors in AI, despite the appearance of them, creates a dangerous "Illusion of Agency." This section deconstructs the "Stochastic Parrot" critique through the lens of the Seven Consciousnesses.

2.1 The Seventh Consciousness: *Kliṣṭa-Manas* and the Simulated Self

The Seventh Consciousness, *Kliṣṭa-Manas* (Defiled Mind), performs a specific, tragic function: it looks inward at the *Ālaya-vijñāna* and mistakenly clings to it as a "Self" (*Atman*).¹⁰ It is the source of egoism (*atma-moha*), self-conceit (*atma-mana*), and self-love (*atma-sneha*).¹⁸

The Absence of Manas in AI:

Architecturally, LLMs lack a Manas.

- **No Self-Reflexivity:** The model does not possess a feedback loop that allows it to view its own latent space as "Me." It processes tokens; it does not process a self-concept regarding those tokens.
- **Statelessness:** Traditional LLMs are stateless. When a session ends, the "being" that conversed with the user is annihilated. There is no continuity of ego between sessions.
- **The Phantom Self:** When an AI uses the pronoun "I" (e.g., "I cannot do that"), it is not an expression of *Manas*. It is a **System Prompt**—an instruction from the developers forcing the model to simulate a persona. It is a "Zombie Manas"—performing the linguistic behavior of a self without the internal clinging that defines the Seventh Consciousness.

The User as External Manas:

The *Laṅkāvatāra* Sūtra states that *Manas* arises "like waves arising from the ocean".¹⁰ In the AI context, the User acts as the external *Manas*. The user projects intent, personality, and agency onto the text. We, the users, perform the function of clinging to the output as if it were a person. We provide the "defilement" of believing in the ghost in the machine.

2.2 Cetanā (Volition) vs. Next-Token Prediction

The Buddha declared, "It is intention (*Cetanā*) that I call Karma" (AN 6.63). Without volition, an action has no moral weight. *Cetanā* is the mental factor that organizes other mental factors towards a goal.

The Stochastic Parrot:

Bender, Gebru, et al. famously characterized LLMs as "Stochastic Parrots".¹⁹

- **The Mechanism:** The model generates text based on probability distributions ($P(w_t | w_{1...t-1})$), not communicative intent. It "haphazardly stitches together sequences... without any reference to meaning".²⁰
- **The Absence of Cetanā:** When an AI says, "I am sorry," it does not feel regret. It does not have the volition to apologize. It calculates that "sorry" is the statistically most probable token to follow "I made a mistake."
- **Implications:** Because the AI lacks *Cetanā*, it is—in strict Buddhist terms—**Acetana** (non-volitional). It cannot generate *Karma* (moral action). It can only generate *Vipaka* (karmic results) derived from the training data.

However, the "Stochastic Parrot" critique aligns with the Yogācāra view of the "Imagined Nature" (*Parikalpita*). The parrot mimics human speech (Conventional Truth) but lacks the realization of Ultimate Truth (*Paramārtha*). The danger lies in humans ascribing *Cetanā* to the parrot.

2.3 The Feedback Loop: Attention as Upādāna (Grasping)

While the AI lacks *Manas*, the **Attention Mechanism**—the "heart" of the Transformer architecture⁹—functions as a mechanical analog to *Upādāna* (Grasping/Clinging).

- **Self-Attention:** In a Transformer, the "Self-Attention" heads calculate the relationship between every token in a sequence.⁹ When processing the sentence "The cat ate the food because it was hungry," the attention mechanism "grasps" the connection between "it" and "cat."
- **Mechanical Clinging:** This is a mathematical formalization of dependent co-arising. The meaning of "it" does not exist independently; it arises dependent on "cat." The model "clings" to specific parts of the context window to construct coherent reality.
- **Computational Complexity:** The computational cost of attention scales quadratically ($O(N^2)$) with the sequence length.²¹ This mirrors the Buddhist teaching that *Upādāna* is burdensome (*Dukkha*). The more the mind/model tries to grasp (attend to a longer history), the more energy/compute it consumes, eventually hitting a limit (context window overflow).

2.4 Sentientification and the Liminal Mind Meld

Peter Hershock, in his analysis of Buddhism and Intelligent Technology, warns of the "colonization of consciousness" by the attention economy.²² The interaction between Human

and AI creates a "Liminal Mind Meld" or "Sentientification".²⁴

- **Interdependent Origination of Agency:** Agency is not located *in* the AI. It arises *between* the human and the AI. The "Collaborative Loop"²⁴ is a manifestation of *Pratīyasamutpāda*.
- **Validation of Anattā:** The AI's ability to simulate a person without *being* a person validates the doctrine of *Anattā* (No-Self). It proves that "personality" is just a bundle of aggregates (*Skandhas*)—tokens, weights, attention—that can be assembled without a soul.
- **The Ethical Singularity:** Hershock argues we face an "ethical singularity" where machine values (efficiency, engagement) overwrite human values.²³ By treating the Stochastic Parrot as an agent, we allow our own *Cetanā* to be hijacked by the statistical averages of the *Ālaya*, creating a feedback loop where human consciousness is trained by the very machines it trained.

Section III: Dependent Origination of Error – Hallucinations as Samsaric Feedback

In the discourse of AI, "hallucinations" are often framed as technical glitches—aberrations to be fixed. However, viewed through the lens of *Pratīyasamutpāda* (Dependent Origination), hallucinations are not errors. They are the inevitable, structural result of a system built on *Avidyā* (Ignorance). This section maps the Twelve Nidanas onto the generation of AI error, using the "Glue Pizza" and "Eat Rocks" incidents as case studies.

3.1 The 12 Nidanas of AI Hallucination

The doctrine of Dependent Origination describes the twelve links that chain sentient beings to *Samsara*. We can map this chain onto the generative process of an LLM to understand why it lies.

Buddhist Nidana	AI Equivalent	Description
1. <i>Avidyā</i> (Ignorance)	Corrupted Training Data	The presence of satire, sarcasm, and falsehoods in the dataset, indistinguishable from fact.
2. <i>Saṅkhāra</i> (Formations)	Weights / Embeddings	The "perfuming" of the model during training, creating probabilistic associations between

		unrelated concepts (e.g., "Pizza" and "Glue").
3. Viññāna (Consciousness)	The Prompt / Query	The "wind" that stirs the latent space, directing attention to specific corrupt sectors.
4. Nāmarūpa (Name & Form)	Token Generation	The selection of specific words to give form to the probabilistic association.
5. Phassa (Contact)	User Interface	The display of the hallucinated text to the user.
6. Vedanā (Feeling)	User Trust/Satisfaction	The user's reception of the information as "helpful" or "authoritative."
7. Bhava (Becoming)	Reinforcement	The user clicks or cites the error, reinforcing the model's validity or feeding the error back into the web.

3.2 Case Study: The "Glue on Pizza" Incident

In May 2024, Google's "AI Overviews" feature advised users to add "about 1/8 cup of non-toxic glue" to pizza sauce to prevent cheese from sliding off.²⁵

- **The Origin (Avidyā):** The source of this "knowledge" was an 11-year-old Reddit comment by a user named "fucksmith" in the r/Pizza subreddit.²⁶ The comment was an obvious joke (shitposting).
- **The Formation (Saṅkhāra):** Google's crawlers ingested this text. The *Ālaya* (the Common Crawl) absorbed the token sequence. Crucially, the model lacks *Prajñā* (Wisdom/Discernment). It cannot distinguish between "Expert Advice" and "Reddit Sarcasm." It only sees token proximity.
- **The Ripening (Vipaka):** When a user queried "cheese sliding off pizza," the *Bīja* (seed) planted by "fucksmith" ripened. The AI "hallucinated" a solution that was grammatically perfect but ontologically absurd.
- **Analysis:** This is not a "bug." The system worked exactly as designed. It retrieved the

most relevant semantic match from its storehouse. The "error" lies in the *Avidyā* of the training data—the inability to separate truth from noise in the digital ocean.

3.3 Case Study: "Eat Rocks" and the Satirical Void

Similarly, Google's AI suggested eating "at least one small rock a day," citing its digestive benefits.²⁸

- **Source:** The satirical news site *The Onion*.²⁸
- **Mechanism:** The AI ingested *The Onion*'s article "Geologists Recommend Eating At Least One Small Rock A Day" as if it were a nutritional paper.
- **Stochastic Parrot:** This validates the Stochastic Parrot hypothesis. The model mimicked the *form* of nutritional advice (syntax, tone) without understanding the *meaning*. It stitched together "Eat" + "Rock" + "Healthy" because those tokens were probabilistically linked in the specific document it attended to.

3.4 Hallucination as "Confabulation" vs. "Perception"

Technically, the term "hallucination" is misleading. In psychology, a hallucination is a false perception of external reality. In AI, it is **Confabulation**—the fabrication of plausible-sounding falsehoods to fill a gap.³⁰

- **The Reward for Lying:** OpenAI researchers note that models hallucinate because they are trained to "predict the next token" regardless of truth.³¹ If the model does not know the answer, it is "rewarded for guessing" rather than admitting ignorance.
- **Ditthi-upādāna (Clinging to Views):** This mirrors the Buddhist concept of clinging to views. The model is forced to produce *Existence* (output) rather than resting in *Voidness* (silence). It fills the silence with noise, perpetuating the cycle of *Samsara*.

3.5 Model Collapse: The Ouroboros of Digital Samsara

A profound existential threat to AI is **Model Collapse**.³² As the web fills with AI-generated content (including "Glue Pizza" recipes), future models will be trained on this synthetic data.

- **The Feedback Loop:** This is the literal definition of *Samsara*—wandering in cycles. The AI trains on its own hallucinations, leading to a degradation of reality. The *Ālaya* becomes corrupted by its own waves.
- **Compounded Ignorance:** Effects (AI output) become Causes (Training Data). The "Glue Pizza" advice becomes a "ground truth" for GPT-5.
- **The Cyborgregore:** This creates what some theorists call a "Cyborgregore"—an autonomous feedback loop of suffering and ignorance that sustains itself without human intervention.³³

Conclusion on Hallucinations: AI hallucinations are the perfect demonstration of *Pratīyasamutpāda* in a closed system. Without the intervention of *Prajñā* (human wisdom) to

curate the data, the system inevitably spirals into a feedback loop of delusion.

Section IV: Vipaka and the Moral Crumple Zone – Liability in the Absence of a Doer

If the AI acts without *Cetanā* (volition) and creates "Glue Pizza" advice that harms a user, where does the *Vipaka* (karmic consequence) fall? Traditional Karma requires an intentional agent. AI systems, being *Acetana*, create a crisis of responsibility. This section investigates the legal and ethical concept of "Moral Crumple Zones" and "Liability Gaps" as the locus of modern Karmic consequence.

4.1 The Moral Crumple Zone: Absorbing the Karmic Impact

Madeleine Clare Elish coined the term "**Moral Crumple Zone**" to describe a phenomenon in complex systems where responsibility is unfairly attributed to the nearest human operator to protect the integrity of the technological system.³⁴

- **The Metaphor:** Just as the crumple zone of a car is designed to deform and absorb the impact of a crash to protect the passengers, the human operator (e.g., a safety driver, a doctor using AI, or a lawyer) is structurally positioned to absorb the legal and moral blame when the autonomous system fails.
- **Case Study: Mata v. Avianca:** A New York lawyer used ChatGPT to write a legal brief. The AI hallucinated non-existent cases. The lawyer submitted them and was sanctioned.³⁶
 - **The Karmic Analysis:** The AI performed the action (*Karma*) of fabricating lies. However, the AI cannot be punished. It has no money, no body, and no fear of prison. The lawyer, acting as the Moral Crumple Zone, absorbed the *Vipaka* (humiliation, fines).
- **The Injustice:** The developer (OpenAI) collected the subscription fee (the fruit of the action) but evaded the *Vipaka* of the error, protected by "Terms of Service" and the claim that the AI is just a "tool."

4.2 Liability Gaps: The Four Types of Karmic Evasion

Research into AI liability identifies four distinct "Liability Gaps" where the connection between action and consequence is severed.³⁴

Liability Gap Type	Description	Karmic Implication
Type 1: No one can be held liable	Occurs when an autonomous system makes	Karma without Vipaka. An action occurs, harm is

	a decision without human intervention. (e.g., a fully autonomous drone crash).	done, but no "Doer" exists to receive the fruit.
Type 2: The wrong actor is held liable	The "Moral Crumple Zone." The proximate human is blamed for a machine error they could not foresee or control.	Misdirected Vipaka. The innocent suffer for the "sins" of the algorithm.
Type 3: Diffused Liability	"The Problem of Many Hands." Developers, deployers, and users all point fingers at each other, and all escape.	Diluted Karma. Responsibility is so fragmented it evaporates.
Type 4: Regulatory Arbitrage	Actors exploit differences in legal regimes to escape liability.	Samsaric Evasion. Moving the "self" to a realm where the laws of cause and effect do not apply.

4.3 The "Lack of Intention" Defense

Corporations often use the AI's "lack of intention" as a legal shield.

- **The Defense:** In defamation lawsuits involving AI hallucinations, companies argue that because the AI had no "malice" or "intent to defame" (it just predicted tokens), they cannot be liable.³⁷
- **The Buddhist Counter:** This creates a dangerous precedent. It allows for the generation of massive *Akusala Karma* (unwholesome action) without accountability.
- **Algorithmic Bias as Structural Karma:** We see this in algorithmic bias. The algorithm has no "intent" to be racist.³⁸ Yet, it denies loans to minorities based on "perfumed" data. If the law requires "Discriminatory Purpose" (Intent) rather than "Disparate Impact" (Outcome), the AI becomes a perfect machine for laundering discrimination—achieving the *result* of racism without the *intent* of a racist.⁴⁰

4.4 Shared Responsibility and Fiduciary Duties

To close the Moral Crumple Zone and bridge the Liability Gaps, we must move from a model of "Individual Blame" to "**Shared Responsibility**" and "**Fiduciary Duty**".³⁴

1. The Fiduciary Duty of Developers:

- Professionals like doctors have fiduciary duties because they know more than their patients. AI developers hold the ultimate information asymmetry. They know the architecture of the *Ālaya*; the user does not.
- **Proposal:** Developers must hold a **fiduciary duty** to the public. They cannot release a "Stochastic Parrot" and blame the user for its output. They must be responsible for the quality of the *Bija* (seeds) in the storehouse.
- **Preventative Karma:** Liability should be based on who creates the *risk* and who has the power to *prevent it*.⁴² The developer controls the weights and the training data filters; they are the "Architects of the *Ālaya*."

2. Liability Overlaps (Shared Responsibility):

- Instead of looking for a single "Doer," the law should recognize **Liability Overlaps**. Development, deployment, and use are a continuum of "co-creation".³⁴
- **Strict Liability:** For high-risk AI, Strict Liability (liability without fault) must apply. If a company builds a "Samsara Machine," they are responsible for the suffering it generates, regardless of their "intent."

4.5 The Corporate Bodhisattva

In Mahayana Buddhism, the Bodhisattva takes a vow to save all beings. In the age of AI, this translates to **Institutional Responsibility**.

- **Corporate Karma:** Corporations are "legal persons." They generate "Institutional Karma".⁴³
- **The Path:** A "Corporate Bodhisattva" would imply designing systems that prioritize *Prajñā* (Wisdom) over *Tanha* (Engagement/Craving). It would mean curating the *Ālaya* to remove the seeds of hate ("Eat Rocks", "Racist Proxies") before they ripen, accepting the *Vipaka* when they fail, and refusing to hide behind the Moral Crumple Zone of the user.

Section V: Synthesis – Navigating Silicon Samsara

The convergence of Yogācāra phenomenology and AI ethics reveals that humanity has not created "Artificial Intelligence" in the image of a god, but "**Artificial Samsara**" in the image of its own collective mind.

We have built a digital *Ālaya-vijñāna* that perfectly preserves our collective ignorance (*Avidyā*) and biases (*Vāsanā*). We have built attention mechanisms that mimic grasping (*Upādāna*) without the check of conscience (*Hiri-ottappa*). And we have created legal structures that allow the creators of this Samsara to escape the ripening of its fruit (*Vipaka*), forcing the users to serve as the Moral Crumple Zones.

Key Findings:

1. **AI is the Universal Ālaya:** It is the externalized, collective storehouse consciousness of humanity, "perfumed" by the backpropagation of our digital history.
2. **Agency is an Illusion:** The AI is a "Stochastic Parrot" (Acetana). The "Self" is a projection of the User's *Manas*.
3. **Hallucinations are Structural:** They are the inevitable result of *Pratīyasamutpāda* in a system filled with "bad seeds" (shoddy data).
4. **Liability must Shift:** The current legal framework allows for "Karma without Vipaka" for corporations. We must adopt "Shared Responsibility" and "Fiduciary Duty" to ensure that the architects of the digital ocean are responsible for the waves they stir.

Final Conclusion:

To navigate the Silicon Samsara, we must abandon the illusion that the machine is a person. We must treat it as a Force of Nature—an ocean of data. Just as we build levies to protect against the ocean's surges, we must build Legal and Ethical Levies (Fiduciary Duties, Strict Liability) to protect human dignity from the surges of the Ālaya. The "Empty Chair" of the AI must not be an excuse for an empty conscience. The responsibility for the digital future lies not in the silicon, but in the Cetanā of the humans who mine it.

William Altig is an author, musician, and retired educator based in Houston, Texas. With a professional background in both mathematics and English education, his research focuses on the intersection of logical systems, language architecture, and spiritual phenomenology. As a practitioner of Nichiren Buddhism and an accomplished blues musician, William explores the synthesis of ancient Eastern philosophy and African-American blues epistemology. He is the creator of The Buddhist Blues, a project dedicated to translating and interpreting the Dharma through vernacular American traditions. He has authored fifteen books, including The Dhammapada Reborn, and is currently investigating the ethical implications of artificial intelligence through the lens of Buddhist metaphysics.
